

COLD AIR BLOWER for... HYDRAULIC EXCAVATORS

The Mitchell Cold Air Blower produces more cold air than any air cold air attachment on the market. Additionally, the straight duct stack boots can be rotated from the cab to direct the air exactly where it is needed the most. The flexible knives can crack ice to then allow the air to blow it away. The cold air blower can be attached to a tiltrotator as shown or be mounted with a rotator to be able to position the cold air blower for optimum air delivery. The Cold Air Blower can be positioned vertically over the rail or positioned at various angles to best direct high volumes of air to blow ice and snow. Additionally, the blower can clean flange ways that have embedded track.
